

## FusionDox Product Editions

### FusionDox IDM Enterprise

Enterprise Document Management  
and Web Application Platform

The FusionDox Integrated Document Management (IDM) Enterprise platform is a web based suite of tools for the collaborative creation, management and re-use of organizational data and documents. All our tools are universally compatible, which means that you can use popular applications like Microsoft Office as well as alternatives like WordPerfect and OpenOffice. Out of the box compatibility even includes industry specific applications like AutoCAD and Adobe technologies.

Collaborate on authoring content using the FusionDox Authoring System, powered by Adobe AIR that lets you "live edit" documents right through your web browser. One click in FusionDox streams documents to your computer and automatically opens them in the correct application. When you are done, your document is uploaded back to FusionDox and removed from your PC. Our patent-pending system works for Windows, Macintosh and Linux computers, and ensures that you are always working with the most up-to-date document.

The enterprise development tools include a standards-based API so that you can automate connectivity between FusionDox and your existing business applications.

Build powerful workflow enabled FusionForms (xml based electronic forms) to manage your critical business processes, and link together documents and reference data. Deploy forms rapidly without any programming required, or customize and integrate them using our built-in library of components. Once deployed, build reusable views, reports and worker queues which you can then share with your users based on their group or role.

FusionDox IDM Enterprise represents the most flexible platform available today for rapid design and deployment of document and forms-managed business applications.

### FusionDox On-Demand

All the best features of FusionDox IDM, in a simple hosted solution. FusionDox On-Demand is our hosted offering, and provides completely isolated secure hosting for FusionDox IDM 2009. This solution is ideal for customer projects, web application development, and small and medium business document storage. Full development features are enabled, so you can build on top of FusionDox, just as if it were running on your own server. Eliminate the worries of system administration, daily backups, and uptime monitoring, and get back to spending time growing your business.

### FusionDox Access

Enterprise File Sharing

FusionDox Access is a new breed of technology aimed at joining web applications and internet storage. FTP servers offer cheap storage, but cannot easily be integrated with the web, while storage services like Amazon S3 require an experienced developer to couple your website or application with reliable storage. FusionDox Access is middleware that allows you to define shares of documents, whether they be in FTP, Secure FTP, Amazon S3, Sharepoint or other repositories, and then push them out to other web applications. Allow web users to log into your site, and then perhaps give them access to a folder on your FTP server, all through their web browser. You control whether they can view, download, upload or modify documents. Let users edit Microsoft Office, Open Office and other documents using our patent-pending FusionDox Authoring System powered by Adobe AIR for the ultimate in convenience. Finally you can add document management features directly to your own application and forget about all those extra Client Access Licenses!

## FusionDox Authoring System

At the core of all our products is our patent pending FusionDox Authoring System. It's seamless integration with native applications (such as Microsoft Office, WordPerfect, OpenOffice, AutoCad, Photoshop and others) creates a straight forward methodology for users to quickly create and modify documents directly through their web browser. Users never have to pick a location to save files, or hope that they are modifying or e-mailing the correct version of a document. It works with large files (up to gigabytes in size), and ensures that your documents are transferred reliably and securely between users' web browser and your storage repository.

Compatible with Windows, Macintosh and Linux operating systems.

	FusionDox Access	FusionDox IDM Enterprise	FusionDox On-Demand
	Remote access to documents and data on storage repositories	A powerful, feature-rich document management solution	Essential document management services for any size company.
